Lab 7 Activity

PSYC 6802: Intro to Psychological Statistics

1

Load in the `PlantGrowth` data from the `datasets` package. You can do so by running:

```
data("PlantGrowth", package = "datasets")
```

These are the data discussed in the first part of the one-way ANOVA lecture. The IV is `group` and the DV is `weight`.

2

Test the assumptions of your ANOVA using the methods we learned in earlier weeks to test assumptions about normality and outliers.

3

Run an ANOVA that is appropriate for these data using the package of your choice, and compute an effect size.

4

Identify an *a priori* contrast to test on the `PlantGrowth` data, and test it in `R`.

5

Conduct post-hoc tests of your choosing on the `PlantGrowth` data. What groups are significantly different from each other with your choice of adjustment for multiple comparisons? In real life, would you recommend conducting these post-hoc tests, and why?
